## National Liner, LLC Hosts Installation Demonstration For New Large Diameter Pipe and Culvert Rehab System

**Houston, Texas** -- National Liner, LLC, recently hosted an installation demonstration of its new trenchless pipe and culvert rehabilitation technology; the 3S Segment Panel System. More than 50 people were in attendance; many from the City of Houston Public Works Department. RePipe-Texas, a National Liner installation contractor, conducted the demonstration, in the construction yard, at its corporate office near Hobby airport.

“We have been in search of an effective and affordable large diameter pipe and culvert rehab solution to add to our service and installation line for several years now,” stated Ray Pavlic, National Liner’s Director of Sales and Marketing. “And we believe we have found a winner in the 3S Segment Panel System,” he added.

The 3S Segment Panel System solves a lot of the problems that are prevalent in large diameter infrastructure repairs. In particular, it eliminates the need for heavy equipment and major surface disruption.

Ed Kampbell, National Liner’s Technical Engineer, provided verbal details while the RePipe- Houston crew proceeded to assemble and install a short section of the the 3S system in an old corrugated metal pipe that was secured in place above ground. This allowed the attendees to view the installation steps.

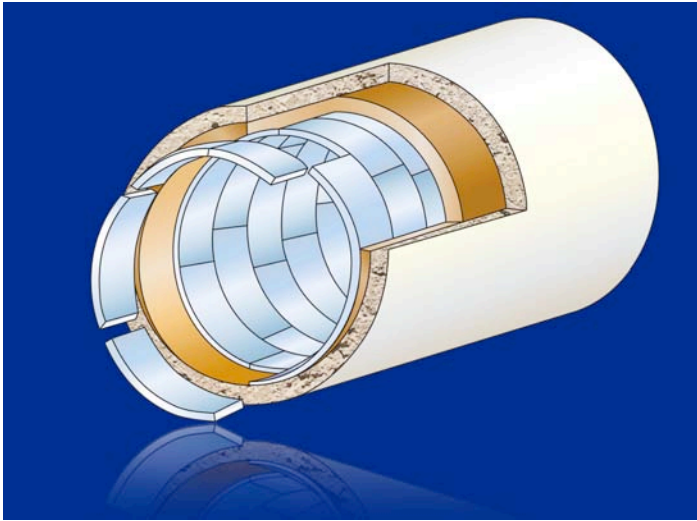

The 3S Segment Panel System consists of lightweight, curved panels that are approximately 8 in. wide by 3 ft. long. They are made from high-strength, industry approved, PVC material. The panels are designed to be handed down through a manhole where they are assembled into rings. Then, the rings are connected together, inside the damaged structure, to make a new pipe or culvert to any desired length.

Structural grout is used to fill the annular space between the host and the new pipe. The 3S System’s translucent panels also afford the installation contractor to visually monitor the grouting process; a nice feature for such critical step in installation process.

National Liner, LLC, is comprised of a nationwide network of professionally trained and experienced trenchless rehabilitation contractors. To date, the group has installed more than 12 million feet of its flagship product, the National Liner CIPP system.
